How to select positions

As you can see in the picture here, we have two positions which I named 1 and 2 for better understanding.

To select the first block, get yourself a wand with the command `//wand` and click on the right block.

To select the second block, use the wand again and left click on the block.

A message will appear in the chat for you to make sure that you selected the block.

Basic fill in ~1

Select your positions and use these commands, replace [block] with your block.

You can see my positions marked as 1 and 2.

`//set [block]`

*Fills in every block
from 1st to 2nd
position.*

`//walls [block]`

*Creates walls from the
1st to 2nd position.*

Basic fill in ~2

We have one higher position as the other now, so there's more commands you can use now.
(Ignore any holes in the pictures below, I made them to help see better what's Inside.

//set [block]

Fills in every block from 1st to 2nd pos.

//walls [block]

Creates walls from 1st to 2nd pos.

//outline [block]

Fills in all sides from 1st to 2nd pos and it's hollow inside.

//replace [current_block] [new_block]

*Replaces the current block with a new one.
(//replace magenta_terracotta blue_terracotta)*

Copy & pasting

First you need to select your positions again.
Then stand on a block (for me the middle) and use the command **//copy**

Go to your corner or block where you wanna place the copy and use the command **//paste**

There's also **//rotation** to rotate the clipboard, or **//flip** to flip it (north, east, etc.)

To mirror the same thing, use **//flip back**
//rotation 180
and paste it next to it.

Creating various shapes

To create a square, you can easily use the basic fill ins. It's kind of different with cylinders, spheres or pyramids.

//cyl [block] [radius]

*Creates a cylinder with a
chosen radius*

//cyl [block] [radius] [height]

*Creates a cylinder with a chosen
radius and a chosen height*

//sphere [block] [radius]

Creates a sphere with a chosen radius

//hsphere [block] [radius]

Creates a hollow sphere

//pyramid [block] [size]

Creates a pyramid with a chosen size

//hpyramid [block] [size]

Creates a hollow pyramid
